

# MAPPING TOOL

## INTERACTIVE PLANNING OF ROUTES AND COSTS

With our application you can attach to a trip the kilometres done by the truck and the trailer, void kilometres, projected costs of subcontractors (if they are defined), costs of highways, ferries and tunnels of the proposed trip and the BAI of the trip.

### ROADCOSTS

Statistic module with which you can calculate the most optimum route from point A to point B (shortest, quickest or most economical route). This module also calculates the cost associated with a certain route and the carbon print.

### MAP PLANNING

With his tool you can assign trips directly from the map, be it for loads or groupages.

### MAPPING +

Mapping + is composed of the following modules:

**Geocode:** converts addresses to geographic positions and enables AndSoft to define the trip on the map.

**Geofencing:** with geofencing you can control the position of the truck in real time and check it is following the established route and/or zone.

**Geotiming, E.T.A control** (estimated time of arrival): this enables you to calculate trips right on time and predict any delays. Real time information on any detours.
